

Dangal Macatangay

Full-Stack & Smart Contract Developer

Quezon City, Philippines · UTC+8 · dlysen@yahoo.com · +63 927 277 7757 · github.com/dlysen · miym.dev

PROFILE

Solo operator building complete products end to end — Solidity contracts, React front ends, Node/Mongo backends, and the deploy pipeline that puts them in production. I work on a 7–14 day cadence: one project at a time, scoped, tested, shipped and documented before the next one starts. Recent work has been on BNB Smart Chain — compensation protocols, vesting systems and BEP20 launches — alongside the portals and migrations that surround them.

CORE SKILLS

SMART CONTRACTS

Solidity ^0.8, Foundry (forge/anvil/cast), OpenZeppelin, invariant & fuzz testing, gas optimization, mainnet deploy + verification

FRONTEND

React 18/19, Vite, Tailwind CSS, react-router, component/theme systems, responsive and dark/light UI

DELIVERY

Docker, GitHub Pages, cPanel/LiteSpeed, Cloudflare, CI-less repeatable release scripts, handover documentation

WEB3 INTEGRATION

wagmi v2, viem, Reown AppKit, BSC/EVM chains, wallet connect, transaction UX, USDT/BEP20 payment flows

BACKEND & DATA

Node, Express, MongoDB/Mongoose, JWT + OTP auth, REST API design, data migration, integration testing

PRACTICE

Append-only decision logs, session notes, one project at a time, commits that read as a story

EXPERIENCE

Full-Stack & Smart Contract Developer — Independent

Present

Scope, build, test, deploy and document client and product work end to end. Own every layer: contracts, frontend, backend, infrastructure and release.

Smart Contract Engineer — LegacyPrime

2026 · BNB Smart Chain

Two-structure compensation protocol pairing a referral tree with a global one-line, splitting every 70 USDT entry across eight allocations, shipped with its own fixed-supply BEP20 token and a full Foundry test suite (unit, flow, admin, audit and invariant). Deployed to BSC mainnet.

Platform Migration & Member Portal — AEOS

2026

Migrated 20,000+ member accounts off a legacy platform onto an Express + MongoDB backend with emailed-OTP authentication, rate limiting and rotating refresh tokens, then rebuilt the member portal on React 19. Built a Dockerized sync service that change-detects and backs up the legacy report API on an interval.

Token Vesting System — AEOS

2026 · BNB Smart Chain

Multi-module vesting for a 1B-supply token across eight allocation categories, each with its own cliff, unlock schedule, access control and purchase mechanism.

SELECTED PROJECTS

LegacyPrime solidity

MLM compensation protocol on BSC with an eight-way allocation of each entry, its own BEP20 (LPNT), and a PancakeSwap V3 liquidity manager.

AEOS System web3 dapp

Member portal and marketing front: wallet connect, on-chain interactions, MongoDB data layer, single-origin Express deploy behind Cloudflare.

MoVi web3 dapp

React 19 + wagmi dApp on BSC mainnet with a companion license API (Express, wallet-signature auth) running as a Docker service.

FBMX DAO / FBMX Social web3 dapp

Wagmi + viem dApps targeting BSC, deployed to GitHub Pages on custom domains with centralized contract configuration.

Shared Foundry workspace tooling

One machine-wide Foundry setup — shared libraries, per-project contract trees, local anvil and a LAN Docker node — replacing a vendored toolchain in every repository.

HOW I WORK

One project at a time, finished before the next begins. Every project carries its own guide, milestone file and session notes; every non-trivial decision goes into an append-only log with the reasoning attached. Contracts are written against tests, not after them, and nothing reaches mainnet without a gas and access-control pass.
